

### Door intercom systems and switch panels of stainless steel

The entrance to a house forms part of that all-important first impression. High-quality materials are therefore preferred, also because of the weathering experienced in such outdoor applications. Stainless steel intercom systems for the entrance door or gate have proven to be a popular choice because of their long service life and corrosion-resistance. The neutral look of stainless steel lends itself very well to both new builds and older structures, and it harmonises with a range of materials such as concrete, wood and masonry. In interiors, too, stainless steel is a sensible choice for sockets and switches, where its hard surface stands up well to wear and tear.

*Stainless steel doorbell panels with intercom and video function can be an exciting and interesting contrast on older buildings.*

*Switch panels in stainless steel have a long service-life, thanks to the strength of the material. A ground or brushed surface gives additional enhancement.*
