

New construction

Stainless steel is present in building refurbishments and also in the construction of new buildings. We find it in common areas, independently of the type of community.

On this occasion we talk about a building in Madrid located at Jorge Juan street. The building consists of five flats, one per floor, and a triplex on the top floor.

This luxury residential construction is Ortiz León Arquitectos' work. Outside, there is a 650 m² garden designed by Jesús Moraimé, a distinguished landscape designer.

Using stainless steel in this application is an excellent option due to the elegance it transmits, the durability of the material in perfect condition and the ease of maintenance.
