

SUSTAINABLE BUILDINGS

Questions such as what advantages sustainable architecture has, why it is so important, or their impact in our present and future lives should be met when projecting new buildings.

On the basis that sustainable construction is the one that has the commitment with the environment, guaranteeing that this kind of buildings take into account the optimisation of the existing natural resources, recyclable and renewable ones. As it is the case of the use of stainless steel that from the beginning of its fabrication uses its own scrap to process new material, together with the use of material accumulated along the process and subsequently, the material used in the final applications that remains being part of the global savings in the natural resources chain and also the improvement in our social resources and quality of life.
