

# Stainless steel façade

The Illovszky Rudolf Stadium surprises everyone who visits its installations. It has a rectangular shape and a concrete façade covered with stainless steel mesh.

Codina Architectural was in charge of this cladding project. They dimensioned and calculated the necessary elements for the construction and the type of stainless steel mesh that would best adapt to the structure. After the study, they chose the Eiffel 4050 type for its versatility and adaptability.

Stainless steel is a guarantee against corrosion. It offers durability and safety without the need of constant maintenance or cleaning.
