

Water treatment

Human activity contaminates the water in our planet. In order to try to generate the least impact possible in this field, we have wastewater treatment systems.

In these plants, they eliminate pollutants from water by physical and chemical processes, for its reuse and return to the environment. In Spain there are more than 2,000 operational wastewater treatment plants.

During the process, metal products are used, such as pipes, tanks, etc., which must be resistant to chemical processes and are also in contact with water. For this reason, we recommend the use of stainless steel. To find out what type of stainless steel you should use for each application, simply use our [technical enquiries channel](/sites/cedinox/en/consultas-sobre-acero-inoxidable/index.html) [/sites/cedinox/en/consultas-sobre-acero-inoxidable/index.html] and we will be happy to help you.
